

CRANK Intake Coordinator Onboarding Guide

Capture and route with full fidelity. Do not interpret. Do not prioritize.

THE ROLE IN ONE SENTENCE

The Intake Coordinator is the funnel for all incoming change. Nothing enters the system without going through you. You do not assess or prioritize -- that is the CRANK Lead's job. Your job is to capture and route with full fidelity, and your single most important rule is: do not interpret. Pass the raw signal.

WHERE YOU SHOW UP IN THE FLYWHEEL

Phase	Your role
Charge	Responsible -- you capture every incoming signal, from any source, with no filtering.
Run / Assess / Navigate	Not directly involved -- these are internal build and decision phases.
Dev KICK	Consulted -- you may be asked about the state of the intake backlog.
Stakeholder KICK	Consulted -- you're the routing point when a Stakeholder raises something new.
Intake / change routing	Responsible -- this is your core function, every cycle.
Steering document	Consulted -- your signal intake log is the upstream source many entries trace back to.

THE ONE RULE THAT DEFINES THE ROLE

Do not interpret. When a signal comes in -- a Slack message, a call note, a screenshot, a comment in Stakeholder KICK -- you capture it as close to verbatim as possible and pass it to the CRANK Lead for triage. Reframing, summarizing away nuance, or making a priority judgment yourself, even with good intentions, breaks the chain of custody on what was actually asked for.

If you find yourself deciding whether something is important before logging it, stop -- that call belongs to the CRANK Lead, not to you.

THE SIGNAL INTAKE LOG

Every signal gets an entry: a Signal ID, the source (verbatim, not summarized), when it was received, who it came from, and the CRANK Lead's triage outcome once they've made the call -- current cycle, next cycle, backlog, or navigated around, with rationale. The CRANK Lead completes triage within 30 minutes of receipt; your job is to make sure they have everything they need to do that fast, not to do the triage yourself.

AT EVERY PACE SETTING

IC-owned intake is part of the fixed core -- it does not change with the Pace Dial. At Steady or Governed, cycles run longer (~1 or ~2 weeks), so more signals arrive inside each cycle, but the rules hold: capture verbatim, route immediately, and the CRANK Lead still triages within 30 minutes. You are informed when the setting changes; log the change like any other signal if it reaches you first, and route it to the CRANK Lead -- setting changes need executive sponsor support and a cycle reset, and they are not yours to action.

HANDLING VOLUME

- If signals are arriving faster than the CRANK Lead can triage, that's an Intake Overflow -- flag it, don't quietly sit on a growing backlog.
- Run a short daily sync with the CRANK Lead until the backlog clears, rather than batching everything for the next KICK.
- Low-priority items can be batched for review at Dev KICK -- but they still need to be logged the moment they arrive, not held back.
- Brief Stakeholders directly: new requirements go through you, not straight to a Developer. A requirement that skips you becomes an unmanaged, unlogged blocker.

COMMON INTAKE COORDINATOR MISTAKES

- Summarizing or lightly rewriting a raw signal before logging it -- pass it verbatim, even if it's messy.
- Making a priority call yourself because the CRANK Lead seems busy -- that's not your authority to use, even temporarily.
- Letting a Stakeholder's mid-cycle ask go straight to a Developer without routing it through you first.
- Treating the intake log as a formality filled in after the fact, rather than in real time as signals arrive.

SUCCESS INDICATORS

- Every signal that reaches a Developer has a traceable entry in the intake log.
- The CRANK Lead never has to ask "where did this requirement actually come from?"
- No Stakeholder-introduced requirement has ever become an unmanaged blocker on your watch.
- You can point to your log and show, at any moment, exactly what's pending triage and what's already been routed.
